

Variables and Data Types Problems:

Initial Setup:

1. Create a new Pycharm project called section1 and save it in the folder "pythonProjects" on the desktop.
2. Create a new Python file within the project section1 called variablesAndDataTypes.py

Do the following inside of the file "variablesAndDataTypes.py":

1. Copy the code below these instructions and paste it into the file "variablesAndDataTypes.py"
2. change 9variableNamesCannotBeginWithANumber to a valid variable name by removing 1 character. Then, assign it the value True.
3. create a variable called boolean and assign it a different Boolean value than the Boolean value we assigned to the variable from step 1.
4. create a variable called posInt and assign it a positive integer value
5. create a variable called zero and assign it the value 0
6. create a variable called negFloat and assign it a negative decimal number value
7. reassign a value to the variable called initial

copy and paste this code into “variablesAndDataTypes.py”

9variableNamesCannotBeginWithANumber

initial = 3
